Ekio Light — Core Recovery and Core Beauty

v2.0 (simplified) · 2026-07-29

Thank you for your answers on the first version of the brief. Before we move forward, we have two priorities: **LED quality** and **irradiance data**.

1. LED quality

We want to make sure the LED chips used in both products are good quality and consistent from unit to unit.

Please tell us, for the LED chips used in each of these wavelengths — **660, 810, 940 nm (Core Recovery)** and **590, 630, 670 nm (Core Beauty)**:

1. **Brand / manufacturer** of the LED chip for each wavelength.
2. **Quality control**: how do you make sure each LED matches the target wavelength consistently, batch after batch?
3. **Lifespan**: how long do these LEDs last before their light output drops significantly?

If you can share a datasheet for each chip, even better.

2. Irradiance data

For **Core Recovery** and for **Core Beauty**, please tell us the **light intensity (irradiance, in mW/cm²)**:

- For **each wavelength band** on its own.
 - For **all three bands combined** (since the device only has one combined mode).
 - Measured **touching the skin** and at **about 3 cm away**.
-

That's all we need for now — thank you.
